

AMENDMENTS TO THE ABSTRACT

Please substitute the following paragraph for the abstract now appearing in the currently filed specification:

ABSTRACT

A method and system for a transmission of additional information in a communication system. This includes establishing a communication context between a first user station to at least one second user station for transmitting data from the first user station to the second user station. The context also allows additional information to be transmittable from an additional information device to the second user station. Further, query data is sent from the additional information device to the second user station, and the second user station generates a response signal in response to the query data, indicating whether the second user station is ready to receive the addition information. The addition information is transmitted based on the response signal, and is displayed on the second user station.
